

8-Allyloxy-dG CEP
Product No. BA 0261
Product Information

Employ acetonitrile diluent, concentration and coupling time as recommended by the synthesizer manufacturer. Cleavage from the solid support with concentrated ammonium hydroxide may be carried out using standard protocols. Nucleobase deprotection can be accomplished with concentrated ammonium hydroxide at 65 °C for 1 h, 55 °C for 4 h, or room temperature overnight. Extended heating should be avoided due to further transformation of the 8-allyloxy-dG nucleotide.
